

Dear Homeowner,

When was the last time your Heat Recovery Ventilation Unit was serviced?

Units like the one shown below introduce fresh air into your home and expel to outside the stale air. The fresh air entering your home is filtered and passes through a heat exchanger before entering your living area.

The filters and heat exchangers inside these units get very dirty and require regular maintenance.

Dirty filters can increase the running cost of the unit and reduce its effectiveness.

If the filters are beyond cleaning our service team will forward a replacement filter quotation for your approval.

We are a local business specialising in these products and are available to carry out a service visit to your heat recovery ventilation unit at a time to suit you.

Included in our normal service visit cost our fully qualified engineers will.....

- Check the airflows
- Check the control functions
- Check the electrical connections
- Check the supply voltage
- Check the unit operation
- Clean the air filter
- Clean the heat exchanger
- Clean the internal air grilles

Would you like us to come and service your heat recovery ventilation system?

If so, please call us for free on **01489 860966** and ask for a quotation.
